

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A device for a container provided with an opening and a flexible wall, the device comprising :

at least one tank insertable into the container in an operating position;

at least one release mechanism insertable into the container in operating position, said release mechanism being capable of cooperating with the tank in order to connect the tank with the interior of the container in response to a pressure exerted on said release mechanism via the flexible wall of the container;

a support means insertable into the container to support in operating position the tank and the release mechanism in relation to the container, the support means having a fastener to fix the support means on the container close to the opening.

2. (Currently amended) A device according to claim 1 for a container whose opening is a neck, ~~characterized in that~~ and wherein the fastener comprises an annular bulge capable of cooperating with an inferior edge of the neck and a collar capable of cooperating with a superior edge of the neck, the bulge and the collar allowing to ~~fix~~ the support means on the container.

3. (Currently amended) A device according to claim 2, ~~characterized in that~~ wherein the support means comprises a conduit to connect the tank with a filling opening adjacent, in operating position, to the superior edge of the neck.

4. (Currently amended) A device according to claim 1, ~~characterized in that~~ wherein the release mechanism consists of an elongated section having a first end connected to a weakened section of the tank, whose rupture connects the tank with the interior of the container, and a second end adjacent, in operating position, to the flexible wall of the container to receive the pressure exerted via the flexible wall of the container.

5. (Currently amended) A device according to claim 4 for a container whose wall is transparent, ~~characterized in that~~ wherein the second end of the elongated section comprises a button of a partially spherical shape, visible through the wall of the container.

6. (Currently amended) A device for container according to claim 1, ~~characterized in that~~ wherein:

said at least one tank comprises between two and four tanks;

said at least one release mechanism comprises a number of release mechanisms equal to the number of tanks, these release mechanisms being capable of cooperating respectively with the tanks; and wherein

said support means is for supporting in operating position said tanks and said release mechanisms in relation to the container.

7. (Currently amended) A device according to claim 6, ~~characterized in that~~ wherein the release mechanisms each ~~consists~~ is comprised of an elongated section having a first end connected respectively to a weakened section of the corresponding tank whose rupture connects the corresponding tank with the interior of the container, and a second end adjacent, in operating position, with the flexible wall of the container to receive the pressure exerted via the wall of the container.

8. (Currently amended) A device according to claim 7, ~~characterized in that~~ wherein the release mechanisms are connected between them by a return element to exert a return force on the release mechanisms towards a home position.

9. (Currently amended) A device according to claim 6, ~~characterized in that~~ wherein the release mechanisms are distributed, in operating position, regularly along the wall of the container.

10. (Currently amended) A device according to claim 1, ~~characterized in that it consists that is~~ of a material chosen ~~in~~ from the group comprising metal, plastic, paperboard, glass and an alloy of metal.
11. (Currently amended) A device according to claim 1, ~~characterized in that~~ wherein the tank has a translucent wall ~~which comprises~~ having graduations to check a level of filling of the tank.
12. (Currently amended) A device according to claim 1 for a container which is a can comprising a body and a lid, ~~characterized in that~~ and wherein the fastener comprises a border capable of cooperating with a superior edge of the can, the border allowing to fix the support means on the container.
13. (Currently amended) A device according to claim 12, ~~characterized in that~~ wherein the support means comprises at least one housing to place at least one tank which, in operating position, is adjacent with the flexible wall.
14. (Currently amended) A device according to claim 13, ~~characterized in that~~ wherein said at least one tank comprises a perforable flexible wall.
15. (Currently amended) A device according to claim 13, ~~characterized in that~~ wherein the release mechanism ~~consists of~~ comprises a tooth having a first end fixed to the support means and a second blunt end adjacent to the tank to perforate the tank and to connect it to the interior of the container when said pressure is exerted.
16. (Currently amended) A device according to claim 12, ~~characterized in that~~ wherein the support means ~~consists of~~ is an arc comprising two opposite jambs and having an internal surface and an external surface.

17. (Currently amended) A device according to claim 16, ~~characterized in that~~ wherein said at least one housing is located on the external surface of each jamb.
18. (Currently amended) A device according to claim 16, ~~characterized in that~~ wherein the arc is flexible in order to exert a return force on the two jambs towards a home position.
19. (Currently amended) A device according to claim 12, ~~characterized in that~~ wherein:
said at least one tank comprises six tanks;
said at least one release mechanism comprises six release mechanisms capable of cooperating respectively with the tanks; and
said support means is capable of supporting in operating position said tanks and said release mechanisms in relation to the container.
20. (Currently amended) A device according to claim 19, ~~characterized in that~~ wherein the release mechanisms each ~~consists of~~ comprises a tooth having a first end fixed to the support means and a second blunt end adjacent to the corresponding tank to perforate said corresponding tank and to connect it with the interior of the container when said pressure is exerted.
21. (Currently amended) A device according to claim 1, ~~characterized in that~~ wherein the support means is made of a flexible material.
